

Python Final

For my final, I wanted to create something that gives you information about a song from the 2010s. I decided to do this because I love listening to music and I also believe that the 2010s was the best year for music so I wanted to do something that is based on that. I've pulled data from a Spotify data set that gives you the top Spotify songs from the 2010s, with other information about the song, such as the BPM, artist, genre, etc. The idea is that you select a song. For example, I selected the song Chained to the Rhythm by Katy Perry. When I selected the song it showed the song name, the artist, the genre of the song, the bpm (beats per minute), and much more. This streamlit app is primarily used by music lovers like myself but it can also be used by other artist who wants to sample some music from these songs or even scholars who want to know more about how music is create.
